An acid based product for cleaning and removing oxide deposits, stains and weathering from both extruded and cast aluminium and many alloys.

FEATURES

EFFECTIVE rapidly removes oxides and other deposits from the metal surface

BRIGHTENS produces a clean, bright, semi-polished finish

INHIBITED contains inhibitors to reduce any potential adverse effect of the acid components of the product on the metal surface

DIRECTIONS

M142 may be used as a concentrate in a dip tank or may be diluted with up to 5 parts of water for application by brush. The dip tank method will often be most suitable for cleaning cast components.

Caution: Not suitable for alloys containing high levels of zinc or magnesium. M142 should be tested on cast components to ensure suitability.
