England

M190 is a specially formulated low foam detergent blend for use in cleaning and decontaminating the coolant systems of industrial machining and cutting equipment.

It contains a similar anti-corrosion package to that used in MSH coolant products to prevent damage to machinery.

FEATURES

EFFECTIVE against the varieties of bacteria and moulds found in coolant systems

MAINTENANCE reduces maintenance downtime

DIRECTIONS

Depending on the degree of contamination, M190 is added directly into the existing emulsion/solution at level of between 2 and 5% and allowed to circulate.

The solution performance will usually be unaffected and work may continue for 24/48 hours.

At the end of this period, the system is drained, flushed through with a dilute solution of the new fluid (1%) and then refilled.
